Team 45: LES Parts Database UI

Bi-Weekly Update 1

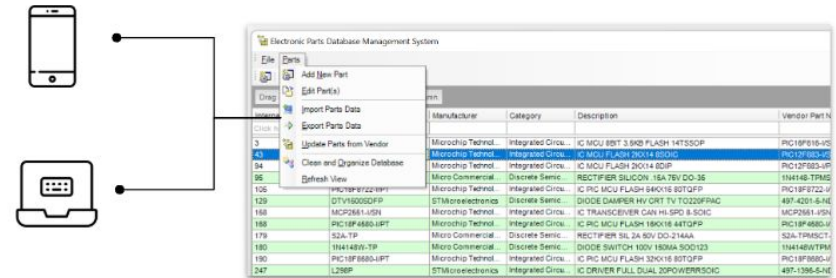

Anthony Beneventi, Jamaal Bloom, Jaswin Jabbal

Sponsor: John Lusher

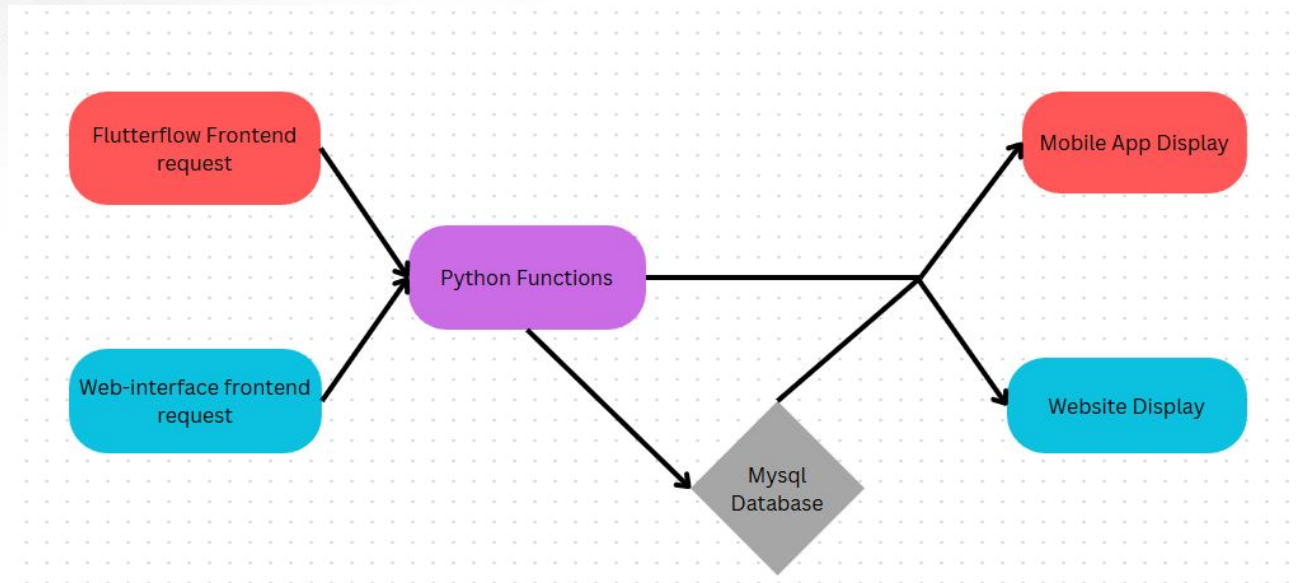

TA: Sabyasachi Gupta

Project Summary

- The current database requires manually updating parts and limits multiple users working at the same time.
- Develop a web and mobile application that will allow for the auto population and filtering of part information

Project/Subsystem Overview

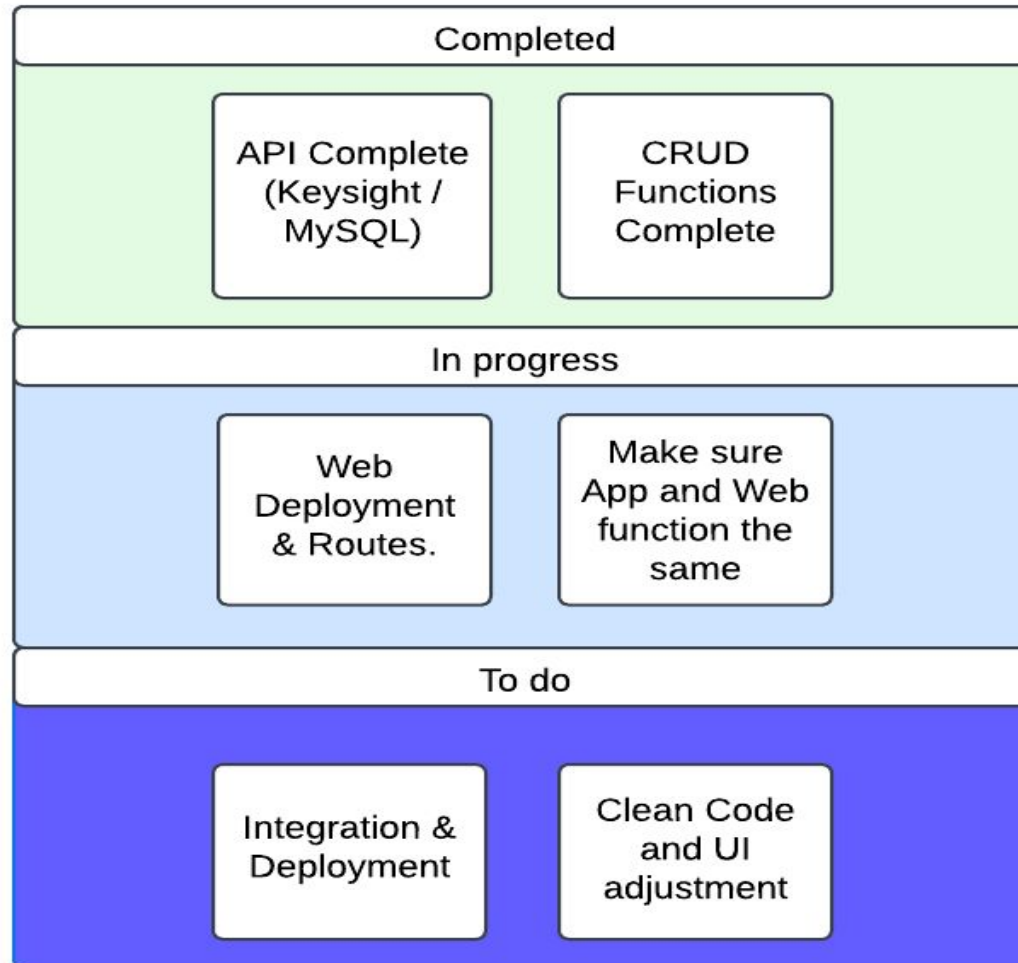

Team: 
 Jamaal: 
 Anthony: 
 Jaswin: 

No major project changes

Project Timeline

Web Application UI

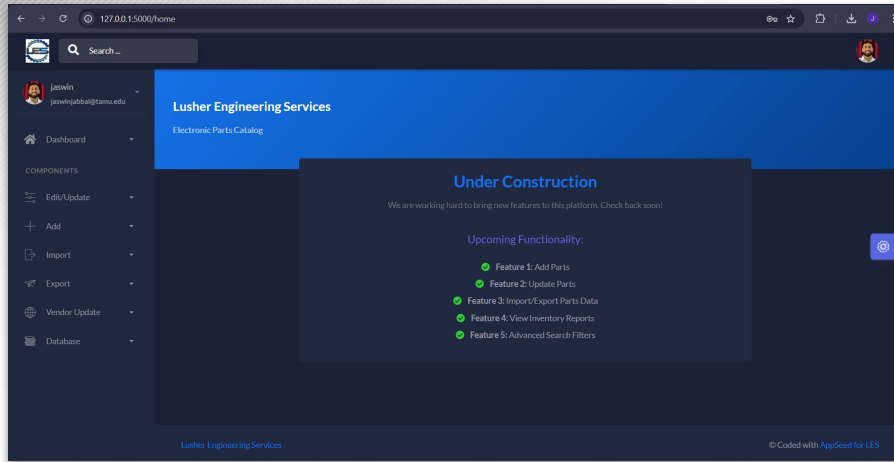

Jaswin Jabbal

Accomplishments since 403 10+ hrs of effort	Ongoing progress/problems and plans until the next presentation
- Set up local server for website development - Imported and set up an open-source Flask app - Wrote HTML templates specific to LES requirements - Added input forms for each component	- Model validation - Route functionality - Frontend data consistency - Deployment Environment

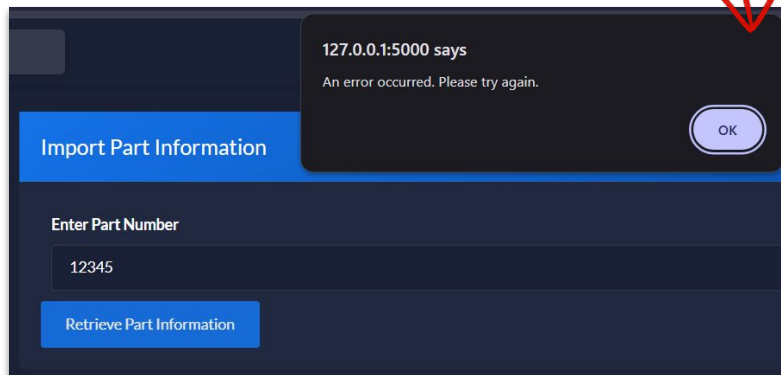

Web Application UI

Jaswin Jabbal

Landing page

Currently no routes in place

Reason

Updated

Python Backend

Jamaal Bloom

Accomplishments since 403 8 hrs of effort	Ongoing progress/problems and plans until the next presentation
Finished subsystem Finished Mouser API	- Deploy backend and database - Adjust to account for non local connection - Test Flutterflow connection

IOS Application

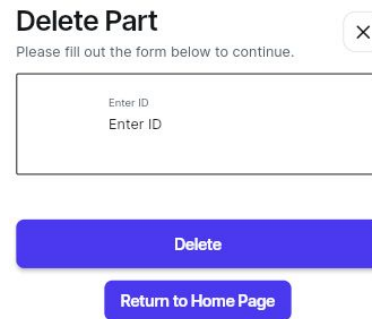

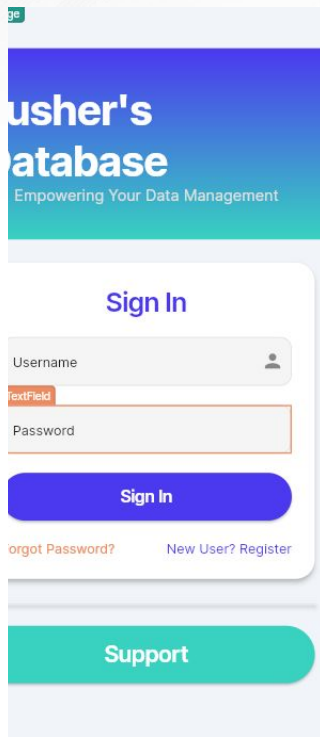

Anthony Beneventi

Accomplishments since 403 4+ hrs of effort	Ongoing progress/problems and plans until the next presentation
• Launched Application with (CRUD), create, read, update & delete functionality. • Multiple User Sign in Feature	• incorporate kesight API from WEB subsystem into IOS App. • Add user authorities such as Admin.

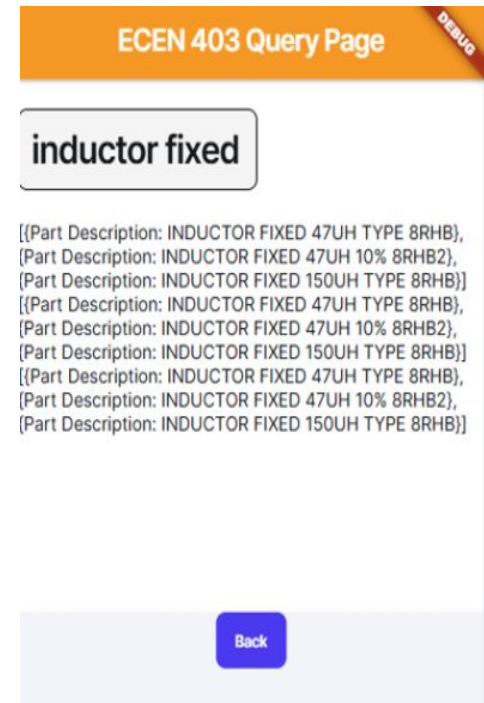

IOS Application

Anthony Beneventi

Delete function

Example of search query, "Inductor fixed."

Functioning Forgot password +
New User registration.

Execution Plan

[illegible]

Validation Plan

Test Name	Success Criteria	Methodology	Status	Responsible Engineer(s)
Database Sync	The web and mobile applications uses the same database and changes visible from both	Attempt changes from multiple devices and ensure consistency	Untested	Jamaal
API Correctness	The API pulls correct information from the supplier	Compare recieved information with suppliers website	TESTED	Jamaal
Request Correctness	The backend correctly recieved and handles the frontend requests	Send frontend request from both applications and examine results	Untested	Jamaal
Multiple Requests	Application can handle multiple requests at the same time	Send multiple requests	Untested	Jamaal
Model Validation	All DB models align correctly with the updated schema used by Jamaal	Compare Flask SQLAlchemy models against the latest database schema	Untested	Jaswin
Route Functionality	Form submission routes to the correct display without errors	Manually fill out and submit forms in the application, verifying data correctness	Untested	Jaswin
Frontend Data Consistency	Submitted data is correctly displayed on a corresponding UI template	Manual validation by cross-checking displayed records with DB entries	Untested	Jaswin
Deployment Environment	All required dependencies are correctly installed and configured on the end machine	Validate with Docker, verify installation logs, ensure WSGI server	Untested	
CRUD Operation Test	Pulling apart information from the MySQL Database	Access a local MySQL Server with dummy data	Untested	Anthony
Updated Database	The API Correctly updates the entire database	Checking previous and updated databases to ensure completion	Untested	Anthony
Request Correctness	Having all requested components, such as User authority	Giving specific permission to individual User admins	Untested	Anthony
Application Deployed	Uploaded on the cloud and ready for use	Able to be sent for beta testing	Untested	Anthony
